## **WATER & GAS SUPPLY**

## KME GROUP

The KME Group is one of the world's largest producers of copper and copper alloy products with production facilities throughout Europe. The Group leads the field in offering high quality and innovative products to a variety of industries. It is a major supplier of copper tubes and rolled copper products to the building industry

BS EN 1057  
MADE IN ENGLAND

## SANCO® AND WICU® - INSTALL SUCCESS

Over the past thirty years, KME's brands of copper tube have established a market-leading position as the tube of choice for plumbing and heating applications. SANCO® and WICU® from KME are Europe's leading brands of copper plumbing tube and are to be found in buildings throughout Europe.

### SANCO®

SANCO® is the general purpose uncoated tube designed for use in above-ground services. First introduced in 1981, it has gone on to become the most widely installed copper tube in Europe. Every year around 375,000 km of SANCO® copper tube comes off the production line.

### WICU®

WICU® is copper tube coated in a seamless plastic cover with air channels along the internal surface. Europe's No 1 plastic covered copper tube, WICU® is the ideal solution where the external surface of the copper tube needs to be protected against an aggressive environment. WICU® tube can also help reduce condensation on exposed pipework. As the tube is pre-coated in the factory, this minimises installation time on site.

### THE IDEAL CHOICE

Both SANCO® and WICU® tube are easy to manipulate and relatively lightweight, yet they are able to withstand high internal pressure. All this makes them the ideal choice for a wide range of applications, including most hot and cold water, central heating and gas services installations.

## QUALITY AS STANDARD

SANCO and WICU from KME are the fruit of years of experience in the production of high quality, dependable copper tubes. KME's aim is always to supply products which will give long-term customer satisfaction, and this can only be achieved through guaranteed confidence in the manufacturing process and quality of finished products:

- KME's quality management systems fulfil the highest standards, including EN ISO 9000.
- All copper tube is manufactured from phosphorus de-oxidised copper Cu-DHP
- All SANCO copper tubes in KME's BS range are BSi Kitemark approved to the requirements of BS EN 1057.
- All WICU plastic covered copper tubes in KME's BS range comprise BSi Kitemark approved copper tubes to BS EN 1057 covered with white plastic to meet the requirements of BS EN 13349.

**DZR (De-Zincification Resistant Brass)**

Dezincification is the name given to the corrosion of brass. The risk and rate of dezincification increases with water hardness, high water temperature, the presence of chlorides and when the acidity or alkalinity of water moves away from a PH of 7. Dezincification resistant brass, or DZR brass, is the name given to brass alloy that has exceptional resistance to this corrosion. DZR brass alloy must be manufactured with great care, with special attention placed on a balanced composition and specific production temperatures and parameters to avoid long-term failures. In order to be called DZR brass each batch must pass an ISO 6509 dezincification resistance laboratory test.

Nowadays a number of technologies enable us to reduce water consumption considerably. These are inexpensive devices which can even halve the consumption of running water. We are just talking about aerators and connection fittings with flow-limiting devices.

### IT IS WORTHWHILE INSTALLING WATER-SAVING SYSTEMS.

Large-scale research, e.g. the “Bagnacavallo Project” undertaken by the Italian environmental association Legambiente, **has shown that a 40-50% cut in the consumption of water from taps and showerheads, made possible by the installation of flow-limiting devices (\*), can decrease the total water usage per household by as much as 20%** (washing machines, dishwashers, most kitchen activities, cleaning, and so on, account for more than half of it). **This means that the savings in your utility bills will pay for the cost of these devices within a few months.**

By installing these water-saving systems you can make a real contribution to energy conservation and avoid the waste of valuable resources. The less water you employ, the less water has to be pumped to your homes, thus saving energy. And when it comes to hot water, you also save the energy required to heat it.

These savings alone would justify installing them in your homes.

- You can **REDUCE WATER USE** by up to **50%\***.
- You can **SAVE ENERGY.**
- You can **CUT water and energy COSTS.**

### INSTALLING THEM IS CHILD'S PLAY.

They can be installed with the greatest ease. Simply screw the low-flow aerator onto the end of your tap. If your showerhead or tap do not allow the use of such aerators, screw the connection fitting with flow restrictor onto the flexible hose or the showerhead.
