

# DA 516, DAF 516

Differential pressure controller with adjustable set-point

Pressurisation & Water Quality › Balancing & Control › Thermostatic Control

ENGINEERING ADVANTAGE

These compact differential pressure controllers for heating and cooling systems are particularly effective in situations requiring high temperatures and/or pressure drop. They can be used both on the primary and secondary side in district heating and comfort cooling systems. Rust protection is assured thanks to the electrophoretically painted ductile iron body.

**Inline design**

Inline flow allows high pressure drops without noise.

**Adjustable set-point**

Delivers desired differential pressure ensuring accurate balancing.

**Measuring point**

Simplifies the balancing procedure, increases its accuracy and enables troubleshooting.

**Technical description****Application:**

Heating and cooling systems with variable flow.

**Functions:**

Differential pressure control over the load.

**Dimensions:**

DN 15-150

**Pressure class:**

PN 25

DN 100-150: PN 16 and PN 25

**Max. differential pressure ( $\Delta p$ ):**

1600 kPa = 16 bar

**Setting range:**

*Δp over the load is adjustable within:*

DN 15-125: 5-30 kPa, 10-60 kPa, 10-100 kPa or 60-150 kPa.

DN 150: 5-30 kPa, 10-60 kPa, 10-100 kPa, 60-150 kPa or 100-400 kPa.

**Delivery setting:**

DN 15-50: Maximum value (30, 60, 100 resp. 150 kPa).

DN 65-125: Midway min./max. value (~18, ~35, ~55, resp. ~105 kPa).

DN 150: Minimum value (5, 10, 10, 60 resp. 100 kPa).

**Temperature:**

Max. working temperature: 120°C

Min. working temperature: -10°C

**Media:**

Water and neutral fluids, water-glycol mixtures.

**Material:**

Valve body: Ductile iron EN-GJS-400

Diaphragms and gaskets: EPDM

Adjustment ring: DN 15-50 Ryton PPS, DN 65-125 R St 37-2 steel. (DN 150 has no adjustment ring)

**Surface treatment:**

Electrophoretic painting.

**Marking:**

TA, DN, PN, Material, Kvs,  $\Delta p$  and flow direction arrow.

**Flanges:**

DN 15-50: According to EN-1092-2:1997, type 16.

DN 65-150: According to EN-1092-2:1997, type 21.

## Operating function

### DA 516 (DN 15-125)

The pressure upstream of the load acts through an external capillary pipe ( $\Delta p+$ ) on the plus side of the diaphragm (1) and attempts to close the valve.

The pressure downstream of the load acts via an internal capillary pipe in the valve body and attempts, together with the spring (3) force, to open the valve. In this way, the differential pressure over the load is kept constant on the set value.

The spring force can be adjusted by turning the adjustment ring (5). Adjustment can be fixed by tightening the fixing screw (4).

### DN 150

Valve DN 150 is a pilot controlled valve. It consists of a diaphragm and spring actuated inline main valve (3), an adjustable built-in two way differential pressure controlling pilot valve (7) and a built-in throttle (4). Various chambers in the main valve and pilot valve are interconnected with internal channels.

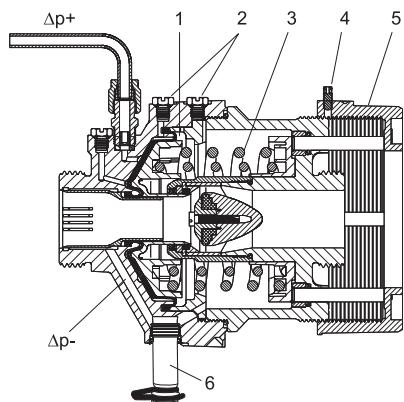

The main spring (2) opens the main valve, while differential pressure on the main diaphragm (1) closes it. The pilot spring (8) closes the pilot valve, while differential pressure on the pilot piston (9) opens it. The pilot valve reacts to sensed changes in controlled differential pressure ( $\Delta p$ ). By turning the adjustment screw (6), force of the pilot spring is changed and the preset value of  $\Delta p$  is adjusted.

If  $\Delta p$  is equal to the preset value, both pilot and main valve are in equilibrium and stationary.

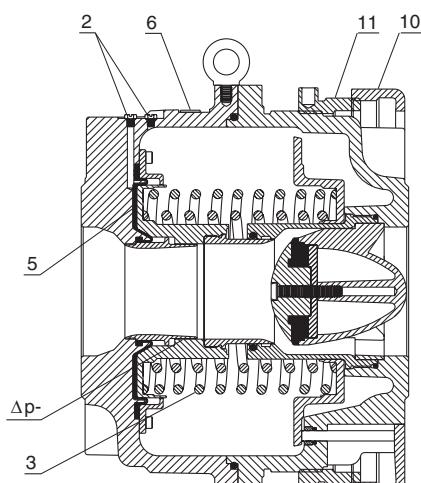

If  $\Delta p$  is higher than preset value, the pilot valve opens and increases the flow in bypass line (5). Increased bypass flow results in increased pressure drop on the throttle (4). This increased pressure drop on the throttle is led via internal channels onto the main diaphragm (1) and causes the main valve (3) to close. Flow in the main line decreases, and brings  $\Delta p$  back down to the preset value.

If  $\Delta p$  decreases, the pilot valve closes and decreases the flow in bypass line (5). Pressure drop on the throttle (4) decreases, so differential pressure on the main diaphragm (1) decreases and main valve (3) opens to bring  $\Delta p$  back up to the preset value.

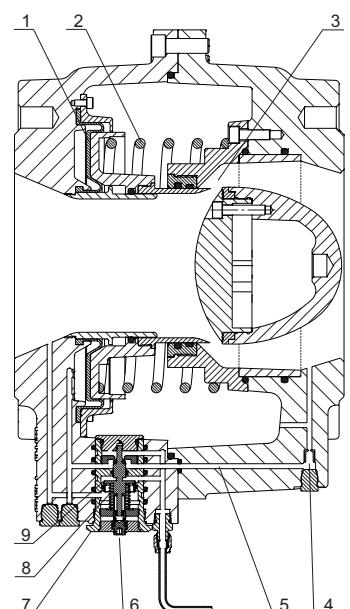

### DN 15-50

### DN 65-125

### DN 150

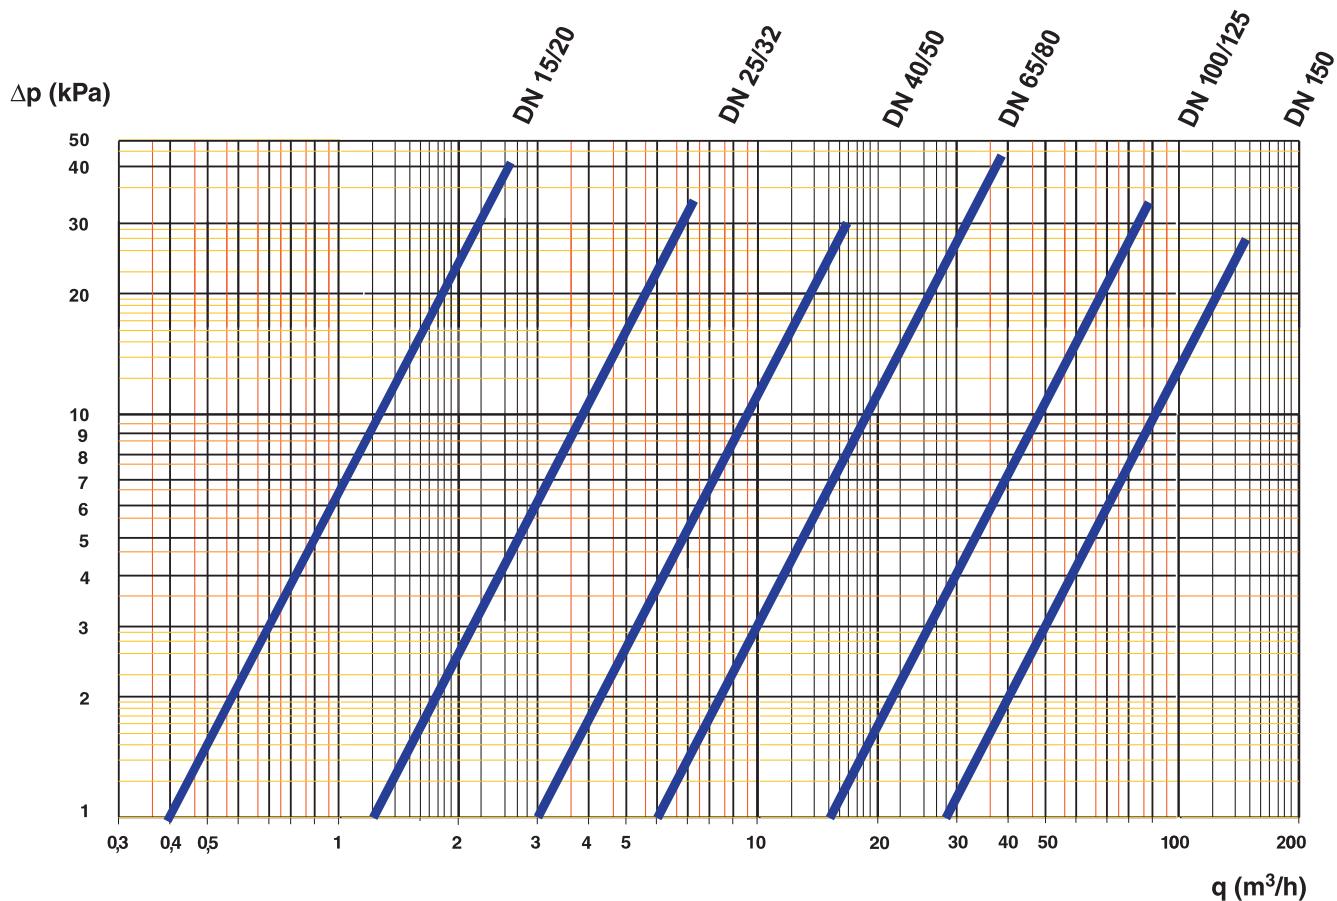

### DAF 516

Installation in the inlet pipe. Function is the same as for DA 516, except that the pressure downstream the load acts through the another external copper impulse pipe ( $\Delta p-$ ) to the minus side of the diaphragm.

## Sizing

1. Select the smallest size for the designed flow according to the diagram.
2. Check that the available  $\Delta p$  is bigger than the pressure drop of the valve at the designed flow. The pressure drop can be found in the diagram or calculated by the formula:

$$\Delta p = \left( \frac{q}{100 \times K_{vs}} \right)^2 \quad [\text{kPa}, \text{l/h}]$$

## Installation

**IMPORTANT: The valve body must not be disassembled.**

By incorrect handling, the controller may not work properly and safety problems may occur.

The **DA 516** must be installed in the return pipe. The **DAF 516** can also be installed in the flow pipe. Flow direction is shown by the arrow (11) on the valve's identification plate

(10). The best position is horizontal with the venting screws (2) pointing upwards. Installation of a strainer upstream of the valve is recommended.

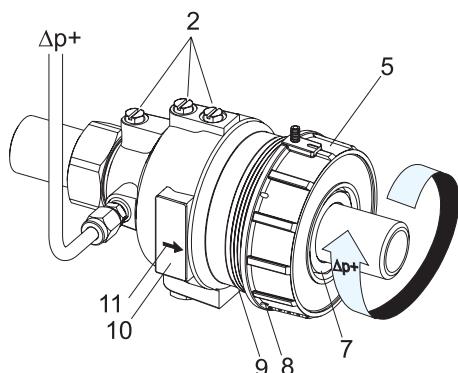

Connect capillary pipe ( $\Delta p+$ , copper Ø6x1), to the pipeline upstream of the load. In case of DAF 516, connect another capillary pipe downstream the load.

In case of a horizontal pipeline connect the capillary pipe laterally to prevent air and dirt from entering. When filling, vent the body by using the venting screws (2).

When welding the connections, the valve must be protected from too high a temperature.

In case of valves DN 15-50, turn the adjustment ring (5) clock-wise until stop to make the nut (7) on the outlet side accessible.

If measuring point is mounted on the DA 516, the differential pressure over the load can be measured by using TA's measuring or balancing instruments.

**Capillary pipe**

Before putting into operation, the capillary pipe must be installed. The other end of the capillary pipe is connected to the balancing valve STAD/STAF or other suitable point on the pipeline.

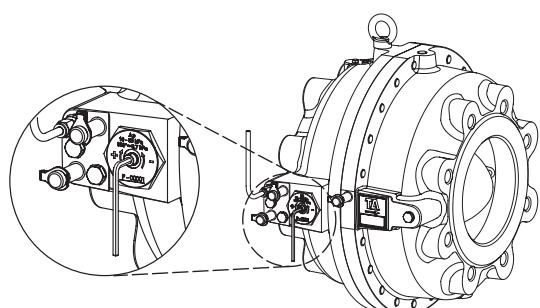

## Setting

**DN 15-125**

The differential pressure can be adjusted by turning the adjustment ring (5). The preset value can be sealed through the holes (see (8) and (9) under Installation).

**DN 150**

The differential pressure can be adjusted by turning the adjustment screw in the pilot valve, using 4 mm Allen key. Turn the adjustment screw clockwise to increase  $\Delta p$  and vice versa.

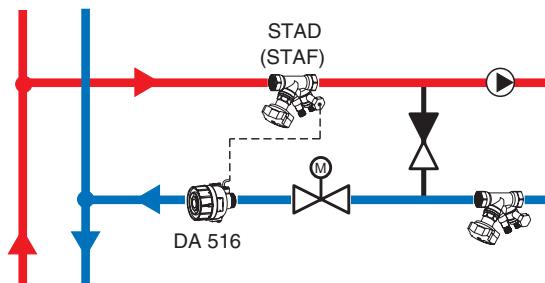

## Application example

### Keeping the differential pressure over a control valve constant

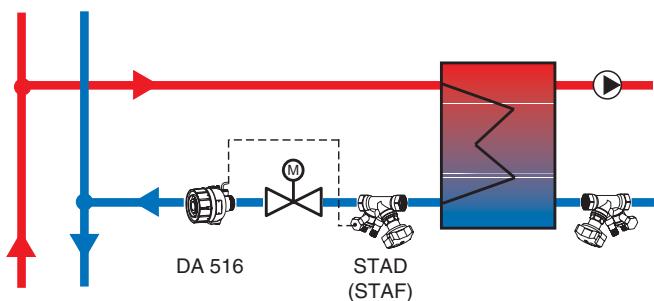

#### Shunt group

DA 516 should be mounted downstream of the control valve and STAD (STAF) may preferably be mounted in the supply pipe.

#### Heat exchanger

DA 516 should be mounted downstream of the control valve and STAD (STAF) upstream of the control valve, but downstream of the heat exchanger. STAD (STAF) can be mounted in the supply pipe, but with a decreased valve authority as a consequence.
